#### Note

- 1. Circuit ground is internally isolated from chassis ground.
- TX Fault is an open collector/drain output .Which should be pulled up with a 4.7K 10K Ohms resistor on the host board if intended for use. Pull up voltage should be between 2.0V to Vcc+0.3V.A high output indicates a transmitter fault caused by either the tx bias current or the tx output power exceeding the preset alarm thresholds. A low output indicates normal operation .In the low state, the output is pulled to <0.8V.</li>
- 3. Laser output disabled on TX Disable >2.0V or open, enabled on TX Disable<0.8V.
- 4. Internally pulled down per SFF-8431 Rev4.1.
- 5. LOS is open collector output. Should be pulled up with 4.7k 10kohms on host board to a voltage between 2.0V and 3.6V. Logic 0 indicates normal operation; logic 1 indicates loss of signal.
- 6. Internally connected
